

Computational approaches for detection and quantification of A-to-I RNA-editing

TRAINING COURSE IN Computational Methods for Epitranscriptomics

Bari, 11th-13th September 2024

Dr. Domenico Alessandro Silvestris PhD RTD-A

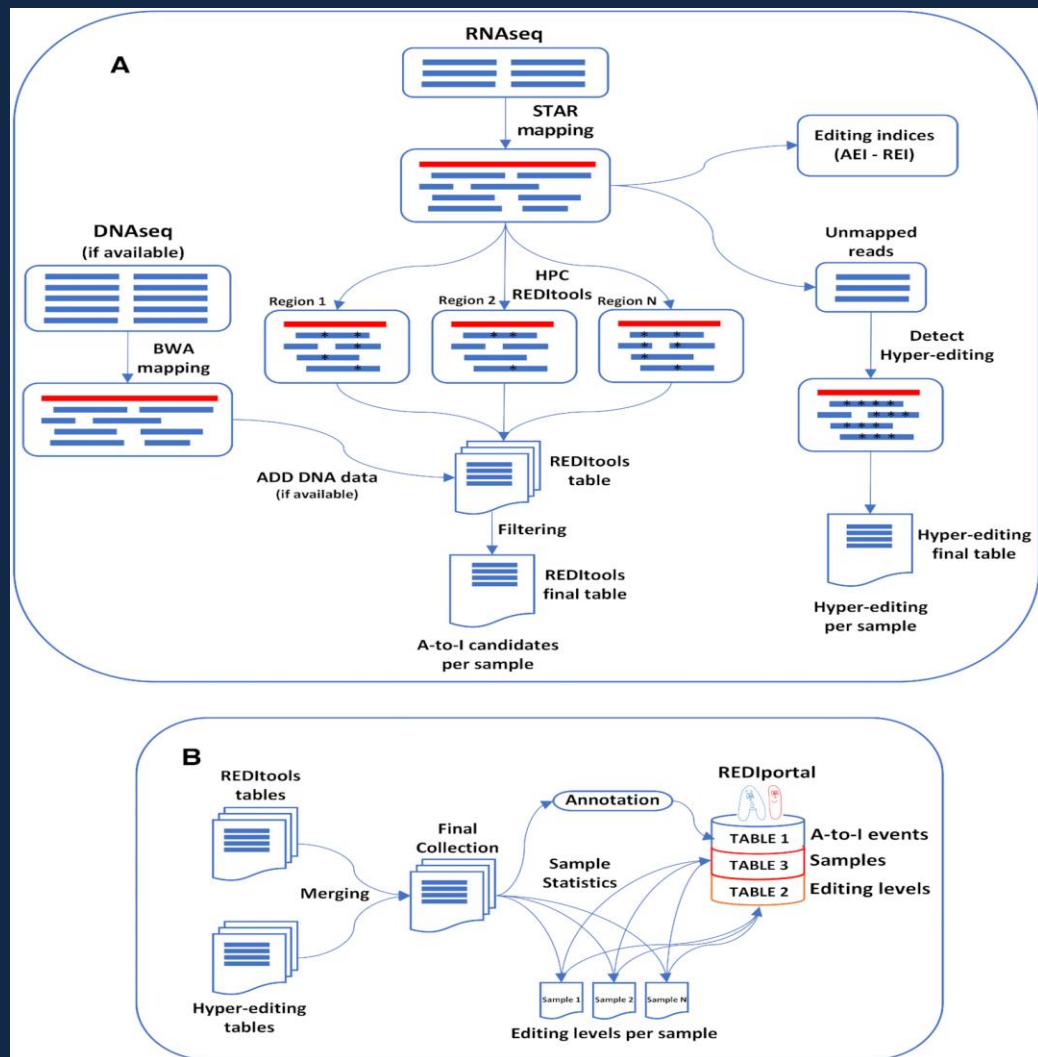

Dipartimento di Bioscienze, Biotecnologie e Ambiente (DBBA), UNIBA email: domenico.silvestris@uniba.it

REDIportal

An ATLAS of A-to-I RNA editing events in human and other organisms

(<http://srv00.recas.ba.infn.it/atlas/>)

Data processing and database construction. (A) RNAseq data in fastq format are aligned on the human genome by STAR and converted in BAM files. In parallel, if DNaseq reads are available, are aligned on the same genome version by BWA. RNAseq BAM files are analyzed by HPC REDIttools and the editing calling is distribute across different computing nodes, each working on a given genomic region. Resulting REDIttools tables undergo to further filtering steps before the generation of the final table of A-to-I candidates. RNAseq unmapped reads are re-analyzed to detect hyper-edited reads and provide a list of hyper-editing sites per sample. RNAseq BAM files are further used to calculate the AEI and REI indices. (B) REDIttools table and hyper-editing tables are merged in the final REDIportal collection. All events are annotated and stored in the MySQL TABLE1. They are also used to interrogate all RNAseq data to recover RNA editing levels and populate the MySQL TABLE2. Main RNA editing statistics per sample are also computed and collected in the MySQL TABLE3

Welcome To REDportal V2.0

The largest RNA editing resource for human and other organisms V2.0

RNA editing is a relevant epitranscriptomic phenomenon by which primary RNAs are modified by base substitutions, insertions and/or deletions. In humans and other mammals, it mainly involves the deamination of adenosines to inosines by the ADAR family of enzymes acting on double RNA strands. A-to-I RNA editing has a plethora of biological effects and its deregulation has been linked to several human disorders. To better investigate A-to-I editing in eukaryotes, we have updated our already rich REDportal catalogue (4.5 millions), raising its collection to about **16 millions of events**. REDportal V2.0 is based on 9642 human RNAseq samples from **549 individuals (31 tissues and 54 body sites)** of the [GTEx](#) project. Now users can search at position level (by providing a genomic region or a gene name) and at sample level (by providing at a sample accession name) to have an overview of RNA editing per RNAseq experiment. REDportal V2.0 implements a Gene View module to look at individual events in their genic context and hosts the CLAIRE resource ([Pubmed](#)). REDportal V2.0 officially starts collecting RNA editing in non-human organisms. It currently stores 107,094 A-to-I mouse events from nascent RNAseq data ([Pubmed](#)).
